ABSTRACT:

PROBLEM TO BE SOLVED: To provide a modified fiber fabric having a high water absorption property/a hygroscopic property while ensuring softness and touch feeling such as a drape property, excellent in absorption of perspiration, etc., having durability (e.g. washing resistance) and imparting softness to the skin, having high healing ability/regeneration ability-assistant effects of the skin and low irritation to the skin and to provide a method for producing the fabric.

**SOLUTION:** The modified **fiber** fabric is obtained by polymerizing  
(X) a  
component which is a water-**soluble egg shell film** powder with a  
component (A)  
which is a bifunctional monomer represented by general formula (1), a  
component  
(B) containing any group among a hydroxy group, a carboxyl group, an  
amino  
group, a sulfonic **acid** group and a phosphoric **acid** group and a  
component (C)  
which is a monomer containing at least one **aziridine** group or a  
component which  
is a water-**soluble** polymer containing a polycarbodiimide group, a  
polyethyleneimine group and oxazoline group on a **fiber** fabric.
